1. Background

This tsunami exercise is being conducted to assist tsunami preparedness efforts throughout the northern Atlantic region. Recent tsunamis and their associated earthquakes, such as the 2004 Indian Ocean, 2009 Samoa, 2010 Haiti and Chile, and 2011 Japan, attest to the importance of proper planning for tsunami response. This exercise will simulate a large earthquake located east of Florida which triggers a submarine landslide which in turn generates a tsunami.

At 1400 UTC on March 25, 2015 the CARIBE WAVE/LANTEX tsunami exercise will also take place. The scenario will be an earthquake off Panama which generates a tsunami. This exercise, organized under the framework of the United National Educational, Scientific, and Cultural Organization’s (UNESCO) Intergovernmental Oceanographic Commission (IOC) Intergovernmental Coordination Group for Tsunami and Other Coastal Hazards Warning System for the Caribbean and Adjacent Regions (ICG CARIBE EWS) and US NTHMP, is open to CARIBE EWS countries (more information is available at www.caribewave.info).

Contributing articles to this summary can be found at http://projects.noc.ac.uk/landslide-tsunami/project-information and http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.16.9503&rep=rep1&type=pdf.

Submarine landslides are one of the most important processes for transporting sediment across the continental shelf, slope and into the deep ocean. Submarine landslides can be much larger (two orders of magnitude) than those on land. For example, the Storegga Slide off Norway affected an area larger than Scotland, and the amount of sediment it mobilized is enough to cover Scotland to a depth of 80 m. Gravity-driven downward movement of slope-forming material can occur at all inclined areas of the seafloor. Landslides in shallow water (<200m water depth) can often be linked to cyclic tide or storm wave loading, whereas fjords are subject to frequent small failures along their steep walls. Slope failures related to volcanic island flank collapses involve a complex interplay of sub-aerial and submarine components along slopes with high relief. The largest of all submarine landslides occur on nearly flat (<2°) continental slopes. Since the volume of mobilized material in a landslide is a critical parameter for tsunami generation, these enormous landslides are potentially highly tsunamigenic.

Figure 1. Submarine landslide schematic diagram.
Figure 1 shows the evolution of a submarine landslide on its way from the continental slope to the abyssal plain. On its downslope journey, the slide mass itself remains intact, breaks up into distinct blocks or deforms internally. In some cases, the mass disintegrates as it moves downslope along the failure plane due to turbulence and water intake. A cloud of suspended particles forms and divides into a debris flow at the bottom and a turbidity current on top. The debris flow travels faster on steeper portions of the slope but stops eventually due to frictional forces, whilst the turbidity current can travel very long distances until turbulence decreases below a critical value. The potential of a slide to transform into these sediment flows, as well as the flow’s intensity and run-out distances, depend on a number of factors, e. g., the density of the failed material, its initial excess pore pressure, whether the material is contractive or dilational, and its sensitivity, i. e., the amount of shear strength that is lost when the material fails.

Tsunamigenic underwater slides and slumps involve the failure of a mass of sediment that can range in length over more than six orders of magnitude, with larger events typically occurring less frequently (Prior and Coleman, 1979; Edgers and Karlsrud, 1982; Schwab et al., 1993). Damaging tsunamis may result from the failure of sediment along steep fjords banks, near boundaries of submarine canyon systems, at active river deltas, along volcanic islands or ridges, or at submerged alluvial plains including continental margins (Hampton et al., 1996). Terzaghi (1956) showed that underwater slides and slumps can often be related to excess pore water pressures along (at least) the initial failure plane. Prior and Coleman (1979) attribute excess pore water pressure to low tides, artesian water sources, recent external loads, rapid sedimentation, seismic ground motions, construction induced vibrations, volcanic activity, vaporization of gas hydrates, wave action, or any combination of these or similar factors. Hampton et al. (1996) separate these factors into those that reduce effective sediment strength and those that increase sediment stress. Sediment failure may occur spontaneously such as during extremely low tides; or, sediment failure may be triggered by a deterministic external agent such as ground motion during an earthquake (Kramer, 1996). The timing of spontaneous slides and slumps may be fundamentally unpredictable since failure of metastable sediments may precipitate from localized inhomogeneities of unknown weaknesses. A majority of tsunamigenic underwater slides and slumps appear to be triggered by nearby earthquakes.

Landslide tsunamis likely constitute the biggest tsunami hazard to the U.S. Atlantic coast. Only a small number of landslides have so far been dated and they are generally older than 10,000 years. Though, it is known that a major tsunamigenic, submarine landslide occurred in 1929 off the Newfoundland coast. Analysis of landslide statistics along the fluvial and glacial portions of the margin indicate that most of the landslides are translational, were probably initiated by seismic acceleration, and failed as aggregate slope failures (ten Brink et al., 2014).

Tsunami warning services for the United States, Canada, Puerto Rico, and the Virgin Islands are currently provided by the National Tsunami Warning Center (NTWC) in Palmer, Alaska, while the Pacific Tsunami Warning Center (PTWC) in Ewa Beach, Hawaii provides services for other locations within the Caribbean region. These Centers issue tsunami products to the region approximately two to ten minutes after an earthquake’s occurrence. The NTWC products include warnings, advisories,
watches, and information statements, while the PTWC products include tsunami information and watch messages. Primary recipients of Tsunami Warning Center (TWC) messages include national tsunami warning focal points, Weather Forecast Offices (WFO), state/territory warning points/emergency operation centers, national Coast Guards, and military contacts. These agencies disseminate the messages to people potentially impacted by a tsunami. The Puerto Rico Seismic Network (PRSN) of the University of Puerto Rico at Mayagüez, Instituto Nicaragüense de Estudios Territoriales (INETER) in Nicaragua, La Fundación Venezolana de Investigaciones Sismológicas (FUNVISIS) in Venezuela, and other national and regional institutions also provide earthquake and tsunami information for their areas of responsibilities.

NOAA and the U.S. National Tsunami Hazard Mitigation Program (NTHMP) are providing the framework for this exercise as a means for emergency responders throughout the U.S. and Canadian east coasts to test and update tsunami response plans. The coastal impact which tsunamis can impart should provide a strong incentive for local jurisdictions to prepare for a tsunami. Given the potential impact of such an event in other locations in the Caribbean and Bermuda, the Pacific Tsunami Warning Center is also providing exercise products (www.caribewave.info) within the framework of the UNESCO IOC Intergovernmental Coordination Group for Tsunamis and Other Coastal Hazards for the Caribbean and Adjacent Regions (CARIBE EWS).

This exercise will provide simulated tsunami warning and watch messages from the NTWC based on a hypothetical magnitude 6.8 earthquake located approximately 215 miles E of Port Canaveral, Florida at 28.8°N, 77.0°W (Figure 2) which in turn triggers a sub-sea landslide. Exercises like this will help ensure that coasts are ready to respond in the event of a dangerous tsunami. Similar recent exercises in the Pacific and Caribbean Basins have proven effective in strengthening preparedness levels of emergency management organizations.

Figure 2. Lantex 15 source location.
2. Exercise Concept

2.1 Purpose

The purpose of the exercise is to improve Tsunami Warning System effectiveness along the Atlantic coasts. The exercise provides an opportunity for emergency management organizations throughout the Atlantic to exercise their operational lines of communications, review their tsunami response procedures, and promote tsunami preparedness. Regular exercising of response plans is critical to maintain readiness for an emergency. This is particularly true for tsunamis, which are infrequent but high impact events. Every impacted emergency management organization (EMO) is encouraged to participate.

2.2 Objectives

Each organization can develop their objectives for the exercise depending on their level of involvement in the scenario. The following are the exercise’s overarching objectives.

- Ensure message transmission from TWCs to Tsunami Warning Focal Points (TWFP) and from these primary contacts to the EMOs.
- Test tsunami response plans for Atlantic EMOs that have developed plans, and provide a catalyst for countries and EMOs that have not developed plans.
- EMOs, Tsunami Warning Focal Points (TWFP) and Tsunami National Contacts review, discuss, and evaluate the various communication alternatives for receiving and disseminating tsunami messages.
- EMOs, Tsunami Warning Focal Points and Tsunami National Contacts review, discuss, and evaluate potential response actions and challenges.

2.3 Type of Exercise

The exercise should be carried out such that communications and decision making at various organizational levels are exercised and conducted without disrupting or alarming the general public. Individual localities, however, may at their discretion elect to extend the exercise down to the level of testing local notification systems such as the Emergency Alert System (EAS), sirens, or loudspeakers.

Exercises stimulate the development, training, testing, and evaluation of Disaster Plans and Standard Operating Procedures (SOPs). Exercise participants may use their own past multi-hazard drills (e.g. flood, hurricane, tsunami, earthquake, etc.) as a framework to conduct LANTEX15.

Exercises can be conducted at various scales of magnitude and sophistication. The following are examples of types of exercises conducted by EMOs:

1. **Orientation Exercise (Seminar):** An Orientation Exercise lays the groundwork for a comprehensive exercise program. It is a planned event, developed to bring
together individuals and officials with a role or interest in multi-hazard response planning, problem solving, development of standard operational procedures (SOPs), and resource integration and coordination. An Orientation Exercise will have a specific goal and written objectives and result in an agreed upon Plan of Action.

2. **Drill:** The Drill is a planned activity that tests, develops, and/or maintains skills in a single or limited emergency response procedure. Drills generally involve operational response of single departments or agencies. Drills can involve internal notifications and/or field activities.

3. **Tabletop Exercise:** The Tabletop Exercise is a planned activity in which local officials, key staff, and organizations with disaster management responsibilities are presented with simulated emergency situations. It is usually informal, in a conference room environment, and is designed to elicit constructive discussion from the participants. Participants will examine and attempt to resolve problems, based on plans and procedures, if they exist. Individuals are encouraged to discuss decisions in depth with emphasis on slow-paced problem solving, rather than rapid, real time decision-making. A Tabletop Exercise should have specific goals, objectives, and a scenario narrative (see Appendix A for a Sample Tabletop Exercise Outline).

4. **Functional Exercise:** A Functional Exercise is a planned activity designed to test and evaluate organizational capacities. It is also utilized to evaluate the capability of a community’s emergency management system by testing the Emergency Operations Plan (EOP). It is based on a simulation of a realistic emergency situation that includes a description of the situation (narrative) with communications between players and simulators. The Functional Exercise gives the players (decision-makers) a fully simulated experience of being in a major disaster event. It should take place at the appropriate coordination location (i.e. emergency operations center, emergency command center, command post, master control center, etc.) and activate all the appropriate members designated by the plan. Both internal and external agencies (government, private sector, and volunteer agencies) should be involved. It requires players, controllers, simulators, and evaluators. Message traffic will be simulated and inserted by the control team for player response/actions, under real time constraints. It may or may not include public evacuations. A Functional Exercise should have specific goals, objectives, and a scenario narrative.

5. **Full-scale Exercise:** A Full-scale Exercise is the culmination of a progressive exercise program that has grown with the capacity of the community to conduct exercises. A Full-Scale exercise is a planned activity in a “challenging” environment that encompasses a majority of the emergency management functions. This type of exercise involves the actual mobilization and deployment of the appropriate personnel and resources needed to demonstrate operational capabilities. EOCs and other command centers are required to be activated. A Full-scale Exercise is the largest, costliest, and most complex exercise type. It may or may not include public evacuations.

**Example Time Frames for Different Exercise Types**
### 3. Exercise Outline

#### 3.1 General

Tsunami Warning and Advisory messages for this exercise are issued by the NTWC based on a hypothetical earthquake with the following hypocenter parameters which in turn generates a tsunamigenic sub-sea landslide:

- **Origin Time**: 13:00:00 UTC March 25, 2015
- **Latitude**: 28.8°N
- **Longitude**: 77.0°W
- **Magnitude**: 6.8 – Mw
- **Depth**: 5km

Expected impact for this event is determined from tsunami forecast models. The models indicated a significant tsunami along the Florida coast, but with less impact elsewhere. Appendix B provides landslide source parameters and associated model results.

Initially, NTWC issues a bulletin which places the Florida east coast in a Warning. The alert level is geographically expanded later to an Advisory for several other coasts. Definitions of the products that will be issued by the TWCs during this exercise are provided below.

**National Tsunami Warning Center:**

**Tsunami Warning** - A tsunami warning is issued when a tsunami with the potential to generate widespread inundation is imminent, expected, or occurring. Warnings alert the public that dangerous coastal flooding accompanied by powerful currents is possible and may continue for several hours after initial arrival. Warnings alert emergency management officials to take action for the entire tsunami hazard zone. Appropriate actions to be taken by local officials may include the evacuation of low-lying coastal areas, and the repositioning of ships to deep waters when there is time...
to safely do so. Warnings may be updated, adjusted geographically, downgraded, or canceled. To provide the earliest possible alert, initial warnings are normally based only on seismic information.

**Tsunami Advisory** - A tsunami advisory is issued due to the threat of a potential tsunami which may produce strong currents or waves dangerous to those in or near the water. Coastal regions historically prone to damage due to strong currents induced by tsunamis are at the greatest risk. The threat may continue for several hours after the arrival of the initial wave, but significant widespread inundation is not expected for areas under an advisory. Appropriate actions to be taken by local officials may include closing beaches, evacuating harbors and marinas, and the repositioning of ships to deep waters when there is time to safely do so. Advisories are normally updated to continue the advisory, expand/contract affected areas, upgrade to a warning, or cancel the advisory.

NTWC will not issue live messages over broadcast dissemination channels other than to issue an initial dummy message to start the exercise at 1302 UTC on March 25, 2015. However, messages from the TWCs will be emailed to specific recipients who have registered to receive live dissemination throughout the event (http://www.prsn.uprm.edu/caribewave-lantex2015/registro). The content of the dummy message is given in Appendix C. The dummy message will indicate that exercise participants should refer to the first message provided in this handbook. From then on, participants should follow the schedule in Table 1 to look at new messages if they are not receiving them via email or fax. Table 1 is the timeline for when messages would be issued by the TWCs if this were a real event, and can be used by EMOs to drive the exercise timing. The warning messages (as shown in Appendix D) cover an 8-hour period, though in an actual event they would likely continue longer. World Meteorological Organization (WMO) and Advanced Weather Interactive Processing System (AWIPS) headers used in the dummy message are listed in Table 2.

The US NTWC issues three official products each time a message is issued. The ones provided in Appendix D are known as the public message and do not contain codes or text intended for automated systems. English and Spanish versions of each message are provided for this exercise. The other message not shown in Appendix D is the segmented message. This message includes encoded NWS zones, Valid Time Event Codes (VTEC), and their level of threat. The segmentation is used for automated processing systems which parse NWS products. NTWC also issues additional graphical and web-based products to its web site.

Participants may elect to exercise using their own timelines in order to achieve their particular objectives. For example, a particular EMO’s Exercise Controller may choose to feed the TWC bulletins into the exercise at times of their own choosing, or alternatively put them in envelopes with the time they must be opened written on each, with each key participant agency having their own set of envelopes. The messages, provided in Appendix D, will facilitate this approach.

EMOs are welcome to modify estimated arrival times and/or wave amplitudes to suit their exercise – for example, to have the tsunami arrive sooner and with larger
amplitude. Other exercise injects, such as tsunami damage reports, are also encouraged.

3.2 Master Schedule (Exercise Script)

Table 1: Scenario Timeline
Tsunami generated by landslide triggered by a magnitude 6.8 earthquake with epicenter at 28.8°N, 77.0°W occurring on March 25, 2015 at 1300 UTC. The initial warning is being disseminated at 1302 UTC.

The initial dummy message will be disseminated over all standard TWC broadcast channels as listed in Table 2. This is being issued to test communications with EMOs and Tsunami Warning Focal Points, and to start the exercise. All messages will be disseminated over a special email list to provide the messages in real time to organizations requesting this service. To request this service, please register online at [http://www.prsn.uprm.edu/caribewave-lantex2015/registro](http://www.prsn.uprm.edu/caribewave-lantex2015/registro). Please note that the NTWC Dummy message is being issued with the WMO/AWIPS IDs WEXX30 PAAQ /TSUATE, WEXX20 PAAQ /TSUAT1, and WEXX40 PAAQ /TSUSPN.

NWWS  NOAA Weather Wire Service
GTS   Global Telecommunications System
EMWIN Emergency Manager's Weather Information Network
AISR  Aeronautical Information System Replacement

At 1400 UTC on March 25, 2015 a separate tsunami exercise (CARIB WAVE/LANTEX15) will also take place. The scenario will be an earthquake offshore Panama which generates a tsunami. This exercise, organized under the framework of the ICG CARIBE EWS. More information is available at www.caribewave.info.

3.3 Actions in Case of a Real Event

In the case of a real event occurring during the exercise, the TWCs will issue their normal messages for the event. Such messages will be given full priority and a decision will be made by the TWCs whether to issue the dummy message and to send email messages to selected recipients. Smaller earthquakes that only trigger a Tsunami Information Statement will not disrupt the exercise. All documentation and correspondence relating to this exercise is to be clearly identified as “LANTEX 15” and “Exercise.”

3.4 Procedure for False Alarm

Any time disaster response exercises are conducted, the potential exists for the public or media to interpret the event as real. Procedures should be set up by all participating entities to address public or media concerns involving this exercise in case of mis-interpretation by media or the public.

3.5 Resources

Although EMOs will have advance notice of the exercise and may elect to stand up a special dedicated shift to allow normal core business to continue uninterrupted, it is requested that realistic resource levels be deployed in order to reflect some of the issues that are likely to be faced in a real event.

Questions on the exercise can be addressed to:

<table>

</tr>
</tbody>
</table>
3.6 Media Arrangements

One advantage in conducting exercises is that it provides a venue to promote awareness of the exercise topic. Many residents along the Atlantic coast may not realize that a tsunami warning system exists for their region, let alone the proper response. Communities may wish to invite their local media to the exercise to promote local awareness of the tsunami hazard. For all levels of exercising but especially for those countries executing full-scale and functional exercises, the media can also provide support in building awareness leading up to the Exercise. The media should be provided with available informational brochures prepared by the local, regional and international agencies. Appendix F contains a sample press release which can be adapted as necessary.

4 Post-Exercise Evaluation

All participating agencies are requested to provide brief feedback on the exercise. This feedback will assist NTHMP and NOAA in the development of subsequent exercises. Comments on the exercise, proposed improvements to the messages, or any other items related to the tsunami warning system in the Gulf can be addressed to the persons listed in section 3.5.

Appendix A. Example Table Top Exercise

Tabletop Exercise Development Steps
Source: California Office of Emergency Services

A Tabletop Exercise is a planned activity in which local officials, key staff, and organizations with disaster management responsibilities are presented with simulated emergency situations. It is usually informal and slow paced, in a conference room environment, and is designed to elicit constructive discussion from the participants to assess plans, policies, and procedures. Participants will examine and attempt to resolve problems, based on plans and procedures, if they exist. Individuals are encouraged to discuss decisions in depth based on their organization’s Standard Operating Procedures (SOPs), with emphasis on slow-paced problem solving, rather than rapid, real time decision-making. An Exercise Controller (moderator) introduces a simulated tsunami scenario to participants via written message, simulated telephone or radio call, or by other means. Exercise problems and activities (injects) are further introduced. Participants conduct group discussions where resolution is generally agreed upon and then summarized by a group leader. A Tabletop Exercise should have specific goals, objectives, and a scenario narrative.

The following provides a Tabletop Exercise structure with sample text and example.

1. **Vulnerability Analysis: Problem Statement**

   An example for a hurricane might be:
   
   Due to the recent Hurricane incidents that the Southeast region of the United States, an awareness of the threat risk involved in these disasters has become more apparent, therefore the need for evacuation system is vital. The state of Louisiana continues its ongoing tasks of planning, preparing, and training for Hurricane preparedness.

2. **Purpose (Mission): Intent, what you plan to accomplish (Policy Statement)**

   An example for a hurricane might be:
   
   The State of Louisiana has realized and recognizes the need for a more efficient and effective evacuation system, and is responding with this Comprehensive Exercise Plan. These events will include seminars, workshops, a tabletop exercise, functional and full-scale exercises within an 18-month time frame, under the State Homeland Security grant program.

3. **Scope: Exercise Activities**

   - Agencies Involved
   - Hazard Type
   - Geographic Impact Area

   An example might be:
   
   Emergency Services coordinators at local levels of government will identify representative jurisdictions from each of the six mutual aid regions located throughout the State to participate as host jurisdictions in a series of disaster preparedness exercises. These host jurisdictions will develop a progressive series of exercises each type building upon the previous type of exercise. The process will begin with a vulnerability analysis for each jurisdiction and continue through a progression of exercise activities including: orientation seminars, workshops, and tabletop and functional exercises. The eventual objective of these activities will be to reduce disaster impacts to their populations and city infrastructure. All events will be evaluated utilizing US Homeland Security Exercise Evaluation Program (HSEEP) after action reporting (AAR)
standards. Steps for corrective actions will be made a part of the after action process and report. Surrounding jurisdictions in the mutual aid area will act as exercise design team members, exercise evaluators, or exercise observers for the purpose of information transfer to increase their operational readiness. Jurisdictions will participate on a rotational basis every two years to provide the opportunity for multiple jurisdiction participation.

4. Goals and Objectives:
Criteria for good objectives: Think SMART
• Simple (concise)
• Measurable
• Achievable (can this be done during the exercise?)
• Realistic (and challenging)
• Task Oriented (oriented to functions)

An example might be:
Comprehensive Exercise Program (CEP) Objectives
• To improve operational readiness
• To improve multi-agency coordination and response capabilities for effective disaster response
• To identify communication pathways and problem areas pre-event between local jurisdictions and operational area, regional and state emergency operations centers
• To establish uniform methods for resource ordering, tracking, and supply for agencies involved at all levels of government.

5. Narrative:
The Narrative should describe the following:
• Triggering emergency/disaster event
• Describe the environment at the time the exercise begins
• Provide necessary background information
• Prepare participants for the exercise
• Discovery, report: how do you find out?
• Advance notice?
• Time, location, extent or level of damage

6. Evaluation:
The Evaluation should describe the following:
• Objectives Based
• Train Evaluation Teams
• Develop Evaluation Forms

7. After Action Report (AAR): The AAR should be compiled using the evaluation reports

8. Improvement Plan (IP): The IP should reduce vulnerabilities.
Appendix B. Scenario Description

The objective of this exercise is to simulate an event which impacts a large portion of the north-Atlantic region and reflects a possible scenario.

The earthquake hypocenter parameters are:
- Origin Time 13:00:00 UTC March 25, 2015
- Latitude 28.8°N
- Longitude 77.0°W
- Magnitude 6.8 – Mw
- Depth 5km

Landslide source parameters: 50 cubic km slide source which is moving eastward at 50 meters per second.

![Graph showing submarine landslide speed and runout over time.](image)

Figure B1. Lantex15’s submarine landslide speed and runout over time.

Tsunami models were computed using the Alaska Tsunami Forecast Model (ATFM) to generate expected impacts throughout the region. The model indicates a tsunami between one and two meters along the Florida coast and up to a meter along other US and Canadian east coasts, Bermuda, and the Puerto Rico/Virgin Island north coastlines.

The model source was based on the landslide parameters which then provided the impetus for tsunami propagation throughout the Atlantic basin. Sample model outputs are shown in Figures B1 through B4 with forecast maximum heights above sea level provided in the Table B1. Note that the highest tsunami elevation reached on the shore could be double that of the model outputs since model outputs are determined at the coast.
Figure B2. Tsunami travel times for the Lantex15 scenario.
Figure B3. Snap shots of tsunami at 5 minutes, 1 hours, 2 hours, and 3 hours.
Figure B4. Sea level time series for selected Atlantic sites.

Appendix D. TWC Exercise Messages

The following messages, created for the LANTEX 15 tsunami exercise, are representative of the official standard products issued by the NTWC during a magnitude 6.8 earthquake and associated landslide-generated tsunami originating approximately 215 miles E of Port Canaveral, Florida at 28.8°N, 77.0°W. During a real event, the TWC would also issue graphical and html-based products to the web site and via RSS.

PUBLIC TSUNAMI MESSAGE NUMBER 1
NWS NATIONAL TSUNAMI WARNING CENTER PALMER AK
902 AM EDT WED MAR 25 2015

...A TSUNAMI WARNING IS NOW IN EFFECT...

WARNINGS/ADVISORIES/WATCHES
-------------------------------
TSUNAMI WARNING IN EFFECT FOR...
THE COASTAL AREAS OF FLORIDA FROM OCEAN REEF FLORIDA TO FLAGLER BEACH FLORIDA

FOR OTHER US AND CANADIAN COASTS IN THE ATLANTIC AND GULF OF MEXICO – THE LEVEL OF TSUNAMI DANGER IS BEING EVALUATED. FURTHER INFORMATION WILL BE PROVIDED IN SUPPLEMENTARY MESSAGES.

PRELIMINARY EARTHQUAKE PARAMETERS
-----------------------------------
* MAGNITUDE 6.8
* ORIGIN TIME 0900 EDT MAR 25 2015
  0800 CDT MAR 25 2015
  0900 AST MAR 25 2015
  1300 UTC MAR 25 2015
* COORDINATES 28.8 NORTH 77.0 WEST
* DEPTH 3 MILES
* LOCATION OFF EAST COAST OF UNITED STATES

IMPACTS FOR TSUNAMI WARNING AREAS
-----------------------------------
* WIDESPREAD DANGEROUS COASTAL FLOODING ACCOMPANIED BY POWERFUL CURRENTS ARE POSSIBLE AND MAY CONTINUE FOR MANY HOURS AFTER TSUNAMI ARRIVAL.
* THE FIRST WAVE MAY NOT BE THE LARGEST.

RECOMMENDED ACTIONS
-------------------
* IF YOU ARE IN A WARNING AREA – MOVE INLAND TO HIGHER GROUND.
* BE ALERT TO INSTRUCTIONS FROM YOUR LOCAL EMERGENCY OFFICIALS.
* DO NOT GO TO THE COAST TO OBSERVE THE TSUNAMI.
* DO NOT RETURN TO THE COAST UNTIL LOCAL EMERGENCY OFFICIALS INDICATE IT IS SAFE TO DO SO.

* TSUNAMI ACTIVITY HAS SUBSIDED ALONG THE COASTS OF PUERTO RICO... U.S. VIRGIN ISLANDS... BRITISH VIRGIN ISLANDS... AND U.S. AND CANADIAN COASTS IN THE ATLANTIC.

* ONGOING ACTIVITY MAY PERSIST IN SOME AREAS CAUSING STRONG CURRENTS DANGEROUS TO SWIMMERS AND BOATS.

* THE DETERMINATION TO RE-OCCUPY HAZARD ZONES MUST BE MADE BY LOCAL OFFICIALS.

RECOMMENDED ACTIONS - UPDATED
------------------------------
* DO NOT RE-OCCUPY HAZARD ZONES UNTIL LOCAL EMERGENCY OFFICIALS INDICATE IT IS SAFE TO DO SO.
OBSERVATIONS OF TSUNAMI ACTIVITY - UPDATED
---------------------------------------------

FOR IMMEDIATE RELEASE (insert date)

ATLANTIC TSUNAMI EXERCISE TO BE CONDUCTED March 25, 2015

(insert community/county/state name) will join other localities in the Atlantic as a participant in a tsunami response exercise on March 25, 2015. The purpose of this exercise is to evaluate local tsunami response plans, increase tsunami preparedness, and improve coordination throughout the region.

(insert a promotional comment from a local official, such as “The 2010 Haiti and Chile earthquakes and tsunamis have reminded the world again of the urgent need to be more prepared for such events,” said (insert name of appropriate official). “This important exercise will test the current procedures of the Tsunami Warning System and help identify operational strengths and weaknesses in each community.” (Please modify for uniqueness.))

The exercise, titled LANTEX 15, will simulate a widespread Tsunami Warning and Advisory situation throughout the north-Atlantic which requires implementation of local tsunami response plans. The exercise will (insert “include” or “not include”) public notification.

The exercise will simulate a major earthquake and tsunami generated 215 miles east of Port Canaveral, Florida at 9:00 am Atlantic Standard Time (or appropriate local time) on March 25, 2015. Exercise participants will be provided with a handbook which describes the scenario and contains tsunami messages from the U.S. National Tsunami Warning Center (NTWC). The NTWC is responsible for providing tsunami information to the Atlantic coasts of U.S. and Canada, the Gulf of Mexico coast, Puerto Rico, and the Virgin Islands while the Pacific Tsunami Warning Center provides tsunami information for the other countries in the Caribbean Sea and Adjacent Regions.

Insert paragraph tailored for specific community. Could identify participating agencies and specific plans. Could describe current early warning program, past tsunami exercises (if any), ongoing mitigation and public education programs, etc. Could describe tsunami threat, history of tsunami hazards, if any.

If any real tsunami threat occurs during the time period of the exercise, the exercise will be terminated.

The exercise is sponsored by the U.S. National Tsunami Hazard Mitigation Program (NTHMP – a partnership of 29 states and territories and three federal
agencies). For more information on the U.S. tsunami warning system, see www.tsunami.gov. For more information on the NTHMP, see nthmp.tsunami.gov. For more information on the ICG/CARIBE-EWS, see http://www.ioc-tsunami.org/content/view/36/1036/.
